

Arctic Observing Summit (AOS) 2018 Statement and Call to Action

August 24, 2018

Foreword

The following statement summarizes the main conclusions and call to action from the Arctic Observing Summit 2018 held in Davos, Switzerland, between June 24 and 26, 2018. The Conference Statement is based on the summaries of the working group deliberations and was reviewed during the final plenary session of the Summit.

Statement

We are living in the Anthropocene – a new era with human activities altering the planet in ways never experienced before. One of the fastest changing regions on the Earth is the Arctic where impacts of major transformations are felt both early and more strongly than elsewhere in the world. As an integral part of the Earth system, the Arctic is shaped by global processes, and in turn, Arctic processes influence living conditions of hundreds of millions of people at lower latitudes.

Through the efforts of governments, international organizations, Indigenous Peoples, academicians, and many others, there is real progress in observing a rapidly changing Arctic. Numerous examples illustrate how insight from such observations enables, informs, and enhances decision-making at local to pan-Arctic scales. More, however, must be done, particularly with respect to the range, distribution and continuity of Arctic observing.

The Arctic has supported the lives of Arctic Indigenous Peoples for millennia and provides their economic security, as well as their cultural and spiritual well-being. Arctic Indigenous Peoples have acquired a dynamic knowledge system, allowing for a broader understanding across biological, physical, social, and spiritual domains. To fully benefit decision making at all scales, this knowledge and Indigenous societal priorities need to play a central role in the development of future Arctic Observing Systems. At the same time, developing capacities and enterprises to allow Indigenous Peoples and Arctic communities to fully engage in observing efforts require urgent attention.

Based on examples where sustained observations have led to positive outcomes, we have confidence that expansion of observing activities will reduce vulnerability and build resilience of Arctic societies, environments and infrastructure. Not doing so increases the risk of greater impacts and associated costs. Importantly, optimization of existing observational capabilities, and addition of new components will require enhanced coordination at an international level.

Recommendations and Call to Action

1. Since the AOS-2016 (Fairbanks, Alaska, USA), analytical advances, in a series of efforts that emerged from the first Arctic Science Ministerial (ASM1), have provided quantitative and qualitative valuation methods to support informed decisions drawing on the societal benefits of sustained observing systems and accessible data. Case studies for selected Arctic challenges have shown positive return on investment, motivating our call for action to coordinate and extend sustained observations.
2. Compared to other, more populated parts of the globe, Arctic observations rely heavily on research projects, rather than operational infrastructures and initiatives. There is an urgent need to progressively shift key observing system components – including community-based observations – from short-term research funding to sustained, operational infrastructure support. The operational infrastructure of the Arctic Observing System must target key variables that capture the Arctic system's main features. It has to be augmented by observing a broader set of variables required for addressing topical problems through

research projects. Such a system also serves a critical function as information infrastructure in support of global services derived from the Arctic system.

3. A properly resourced, comprehensive effort is needed to identify strengths and gaps in the current set of systems, sensors, networks, and surveys used to observe the Arctic. A knowledge map connecting these observations to societal benefits can then guide new observations, data management needs, and development of products and services, leading to a much-needed roadmap for Arctic system observing. Support for an international and local team of experts to complete these tasks under the auspices of SAON will greatly increase the benefits derived from Arctic observing activities and is deemed critical for successful deployment and sustained operation of an Arctic Observing System.
4. Observing and data systems, at different spatial and temporal scales, have to emerge from co-design, co-production, and co-management processes with relevant stakeholders and rights-holders embracing free, ethical, and open data sharing, adhering to the “FAIR” data principles (Findable, Accessible, Interoperable, Reusable) are essential.
5. To build an Arctic Observing System that is comprehensive, coordinated, sustainable, and fills current observational gaps, all existing assets and activities, including Indigenous knowledge, must be leveraged to the greatest extent. Such a system needs to span the full range of spatial and temporal observation scales. This is achievable by combining multiple observational methods and technologies, including Indigenous knowledge, community-based monitoring and citizen science, and by linking all relevant data systems.

This Statement builds on deliberations at the international biennial Arctic Observing Summit (AOS). AOS is a task of SAON under the auspices of the Arctic Council and IASC. At AOS-2018 (Davos, Switzerland), participants from 26 countries focused on the “Business Case for a Pan-Arctic Observing System”. Demonstrating the value of Arctic observations, linked to relevant Societal Benefit Areas showed how long-term observing systems support decision-making from local to global scales.
